Exportdb Utility

Exportdb.mdb is a utility written in Microsoft Access that will export all data tables in a selected database. Exportdb will write these ASCII comma-delimited text files:

- TABLEDEF.txt This file will contain one record for every table in the selected database. Fields in the file include Table_Name, Table_Description, Table_Format, Number of Fields, Export_Date.
- FIELDDEF.txt This file will contain one record for every column in every table in the selected database. Fields in the file include Table_Name, Field_Name, Field_Description, Field_Type, Field_Width.
- One comma-delimited ASCII text file containing all the data rows in the table will be created for each table in the selected database.

Exportdb displays a single form containing three function buttons:

- The "Clear all attached tables" button will clear all tables linked from previous sessions.
- The "Link Database Tables" button will open a browse window to allow the selection of the Microsoft Access database you wish to export. Please note that Exportdb will not export tables that are already linked to a back-end database; therefore, you must go directly to the back-end database itself to export it's tables.
- The "Export Tables" button will open a browse window to allow selection of the destination directory for the text files. Once a directory is selected, the export will be performed.

Exportdb.mdb is written in Access XP and requires references to the Microsoft DAO 3.6 Object Library and Microsoft Office 10.0 Object Library.
